Install docker

It is such a technology used to containerize any application

Containerize mean dabbe me bnd.

Why to do containerize

U have made application in ur computer, u have installed many things like sql server, libraries etc etc
Now to deploy/move application to another computer, you then have to install all above things in that computer

So rather just make a dabba and move that dabba

Us conatiner ko chalane keliye , u neede docker

Docker container is just like virtual machine

That container has my app and also limited version of os
So that my container can run on different os
