

ADO.net (disconnected)

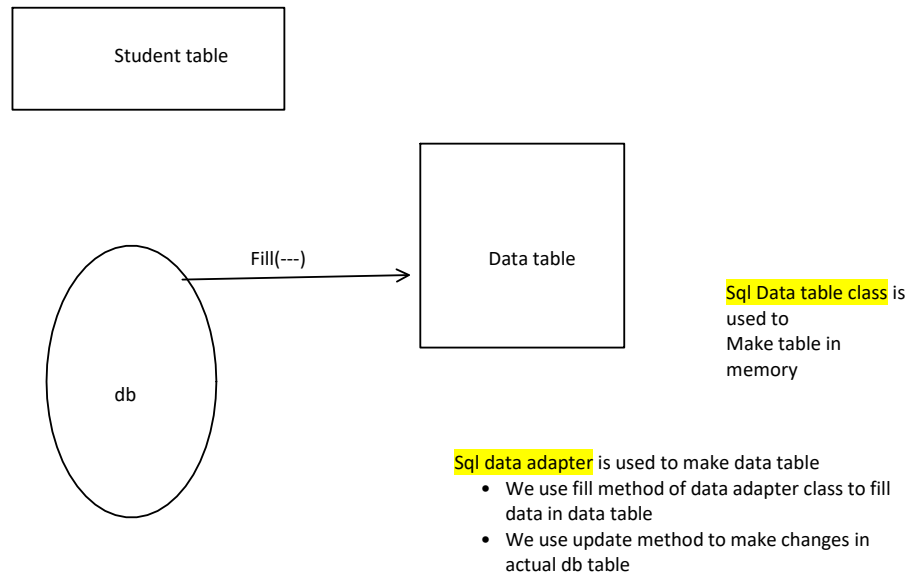

Monday, 28 November 2022 4:15 pm

Db se connect kya ik dfa aur data lee aye uske bad dicconnect krnya, ab phr jo bhi add, delete krrhe honge wo in memory me(temporary toor pr memiry me db) horha hoga not in actual data base, aur phr end me ik hi dfa db me commit krde hain

CLASS WHICH IS USED FOR THIS PURPOSE IS:

SQL data adapter

This class is used in disconnected model

Data table is copy or in memory table of student table(this table is in actual db)
And in the end we will commit all data in student table

3 classes

- Sql data adapter
2 methods fill and update
- Data table (in memory table)
- Data set (in memory db)

Data table is against only 1 table
Data set is against whole db
If we have many tables then we will use data set
DATA SET is in memory DB

Data adapter bnae we wo query bhi btane(in this case select query) jisko use krte hye hmne data table me data fill krna

That means fill() function need SELECT command
Also update() method need insert command this command has insert query.
Update method() also need update command and this update command has update query.
Delete method () also need delete command which has delet query

Ye query ik dfa hi define krne hai jb hm data adapter class bnaa rhe honge

HOMEWORK

Do update and delete cmd

And also see
Tableemployee.select function
Go to its definition and see
And see tableemployee.rows.find();
